The nucleotide sequence of this BAC clone was generated by combining Monsanto and RCP-Japan sequencing data.

NOTE: It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

* NOTE: This is a 'working draft' sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GCGCTCCCAGCTCACCTGTCATCGCCTCCACTCACTAAAATGCCGCCGCGCGCTGGGTCCAT 146

NOTE: It currently consists of locatigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

Sequences AAX89442-X89465 are nucleic acid fragments that encode all or a substantial portion of dihydroxyacid dehydratase, a branched chain amino acid transferase, a leuC or a leuD subunit of 3-isopropylmalate dehydratase from wheat, corn, soybean or rice. These enzymes are involved in biosynthesis and utilization of branched-chain amino acids. The nucleic acid sequences can be used to alter the level of expression of a branched chain amino acid biosynthetic enzyme in a host cell. They can also be used to obtain a nucleic acid fragment encoding a branched chain amino acid biosynthetic enzyme, and to identify inhibitors of a branched chain amino acid biosynthetic enzyme. The encoded proteins may be used to prepare antibodies for detecting the proteins in situ in cells, or in a prepare antibodies for detecting the proteins in situ in cells, or in the cell of the cells.

Sequences AAX89442-X89465 are nucleic acid fragments that encode all or a substantial portion of dihydroxyacid dehydratase, a branched chain amino acid transferase, a leuC or a leuD subunit of 3-isopropylmalate dehydratase from wheat, corn, soybean or rice. These enzymes are involved in biosynthesis and utilization of branched-chain amino acids. The nucleic acid sequences can be used to alter the level of expression of a branched chain amino acids. They can also be used to obtain a nucleic acid fragment encoding a branched chain amino acid biosynthetic enzyme, and to identify inhibitors of a branched chain amino acid biosynthetic enzyme. The encoded proteins may be used to prepare antibodies for detecting the proteins in situ in cells, or in vitro in cell extracts.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
         AAX89462-X89465 are fragments of corn, soybean, wheat and rice leuD subunit of 3-isopropylmalate dehydratase nucleotide sequences. Sequences AAX89442-X89465 are nucleic acid fragments that encode all or a substantial portion of dihydroxyacid dehydratase, a branched chain amino acid transferase, a leuC or a leuD subunit of 3-isopropylmalate dehydratase from wheat, corn, soybean or rice. These enzymes are involved in biosynthesis and utilization of branched-chain amino acids. The nucleic acid sequences can be used to alter the level of expression of a branched chain amino acid biosynthetic enzyme in a host cell. They can also be used to obtain a nucleic acid fragment encoding a branched chain amino acid biosynthetic enzyme. The encoded proteins may be used to prepare antibodies for detecting the proteins in situ in cells, or in vitro in cell extracts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Corn; soybean; wheat; rice; dihydroxyacid dehydratase; leuC; branched chain amino acid transferase; biosynthetic enzyme; 3-isopropylmalate dehydratase; ss.

AAX89462-X89465 are fragments of corn, soybean, wheat and rice leuD subunit of 3-isopropylmalate dehydratase nucleotide sequences. Sequences AAX89442-X89465 are incleic acid fragments that encode all or a substantial portion of dihydroxyacid dehydratase, a branched chain amino acid transferase, a leuC or a leuD subunit of 3-isopropylmalate dehydratase from wheat, corn, soybean or rice. These enzymes are involved in biosynthesis and utilization of branched-chain amino acids. The nucleic acid sequences can be used to alter the level of expression of a branched chain amino acid biosynthetic enzyme in a host cell. They can amino acid biosynthetic enzyme, and to identify inhibitors of a branched chain amino acid biosynthetic enzyme. The encoded proteins may be used to prepare antibodies for detecting the proteins in situ in cells, or in vitro in cell extracts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Glycine max.

                                                                                                                                                                                                                                                                                                                                                                         stress;
```

The invention relates to an Arabidopsis thaliana nucleic acid (I) comprising a sequence capable of hybridising under stringent conditions to a sequence selected from any one of 999 sequences (ABN98233-ABN99231), to a sequence selected from any one of 999 sequences (ABN98233-ABN99231), yield in the specification or its fragment. A polypeptide (II) encoded by (I), a transgenic plant (III) comprising an exogenous nucleic acid or a genetically modified cell (IV) comprising an exogenous nucleic acid, is useful for screening a candidate agent for its biological effect. (I) is useful in identifying homologous or related genes, in producing

in identifying homo. itions that modulate

expression

or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          protein, mapping functional regions of the protein and in studying associated physiological pathways. [1] is also useful for the genetic manipulation of cells, particularly plant cells. [1] is also useful in screening assays of various plant strains to determine the strains that are best capable of withstanding a particular disease or environmental stress. [II) and (III) are useful for screening of biologically active agents, e.g. fungicides, insecticides, etc., for elucidating biochemical pathways. The screened agents are useful in improved methods of treating crops to prevent or treat disease. [II] are also useful in screening
